

Telos Ghost®

Next-generation cyber security for the globally connected enterprise.

- Provides secure mobile access everywhere you need it
- Makes your users and their locations anonymous on the network
- Provides high levels of security through encryption and IP hopping
- Available as Network as a Service (NaaS) and as specific voice and video applications

Many businesses and government agencies depend on extreme security and confidentiality in their operations. But they're at risk of their vital information being compromised when mobile personnel need to connect with each other and with digital resources on the enterprise network or in the cloud.

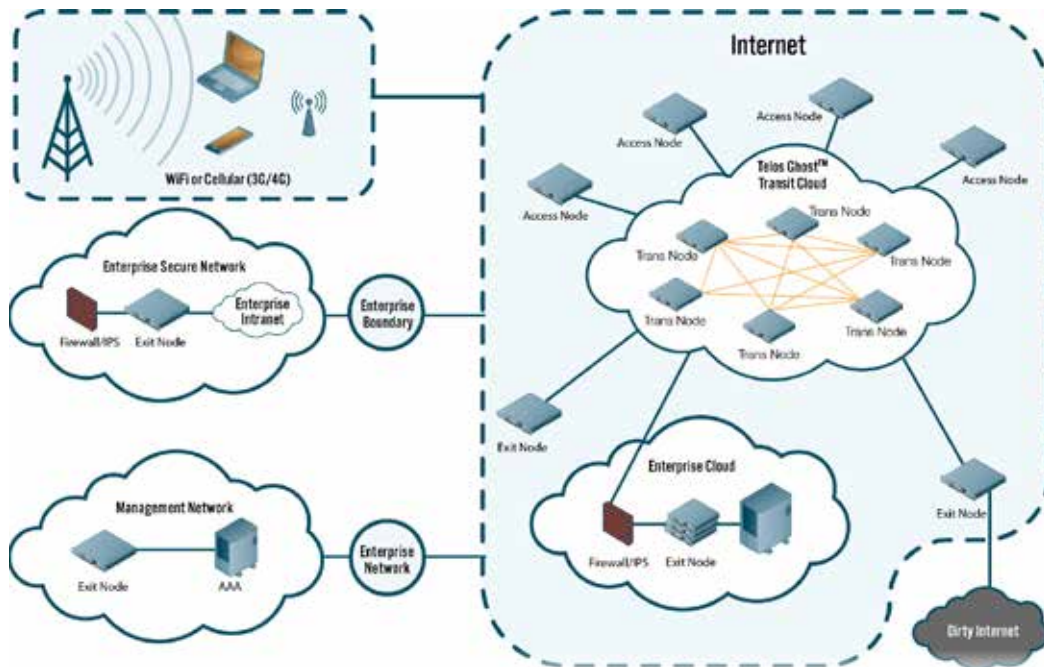

Telos Ghost: Secure cloud mobility offered as a service and as tailored applications.

Telos Ghost is a robust, scalable mobile communications network that provides private, shared, or hybrid cloud-based mobile access, allowing you to own your own private network without the cost of designing, implementing, and managing the network yourself.

Telos Ghost offerings include a complete, end-to-end secure, private, cloud-based mobile solution. We also offer a variety of services individually based on your requirements.

Private Web Access: Secure, anonymous Internet access. Private Web Access disguises the identity and location of personnel when using the public web for cyber threat intelligence and competitive research. It provides users with dynamic access for every session and assures that your traffic securely traverses the virtual private lines of the Telos Ghost Network. Scalable and flexible, Telos Ghost Private Web Access allows users multiple points of international or domestic egress to the public internet based on customer requirements. Traffic mixing and misdirection techniques ensure your activity remains anonymous and private.

Private Network Access: Leased-line security with VPN flexibility. Private Network Access allows authorized users to work with mission-critical enterprise information without being seen or discovered. It enables the establishment of sustainable cyber security infrastructure, providing multi-layered secure tunnels for all data traffic and obscuring the correlation between the entry doorways and the client

The robust security of Telos Ghost is ideal for communities where confidentiality and security are of utmost importance.

- Law enforcement

cloud from external observers. Software and system agnostic, and accessible from any device and location, Telos Ghost Private Network Access provides a full security solution while maintaining your existing encryption and software services.

Cloaked Services: Encrypted communications, storage, and applications. Cloaked Services provide remote users with the ability to securely talk, text, email, store information, and use video and applications over any mobile device. They include fully encrypted Hidden Mobile Communications for device-agnostic voice, video, chat, and data; Hidden Storage to store, analyze, and collaborate privately and securely within Telos Ghost; and Hidden Email and Applications that let you cloak your email and application servers for access only by Telos Ghost users.

Telos Ghost Network as a Service (NaaS): The Telos Ghost network offers enterprises the availability and performance needed for their secure voice, video, network, and web access requirements. With the Telos Ghost NaaS, your organization enjoys access to secure, private virtual network transport services over the Internet on a subscription-based model. Network node virtualization allows allocation of resources based on your users' changing needs.

Telos Ghost: Protecting users and information across the network.

Today's enterprises rely heavily on mobile communications. But standard VPNs and encryption schemes don't offer sufficient protection to assure these organizations that their communications will remain safe in all remote and mobile applications.

Security-conscious enterprises in business and government need a secure cloud mobility solution that can protect their personnel and their information wherever their missions take them.

The unique architecture and capabilities of the Telos Ghost network provide high levels of security through encryption and proprietary-based mesh algorithms for IP-hopping among cloud transit nodes. The technology built into the Telos Ghost network provides a second level of security by providing complete anonymity of your users and their locations.
