

ISVs: Xacta's C2S template gives you a competitive advantage in the IC's AWS Marketplace.

The Intelligence Community is looking for commercial SaaS-based products like yours. To set your offerings apart in the IC's AWS Marketplace, you need to be able to show that your software can comply with the stringent authorization requirements for the AWS C2S cloud. That's a challenge for any ISV, and especially for those without existing government contracts.

A C2S template purpose-built specifically for ISVs.

Telos® Corporation has developed a purpose-built template designed to help vendors quickly satisfy their portion of the "shared responsibility model," which will provide IC consumers the information they need to achieve an authorization decision following the ICD 503 Risk Management Framework (RMF). This template snaps on to Xacta® 360, the same NIST RMF automation platform that C2S uses to manage ATO activity.

The benefit of using Xacta 360 and the C2S template.

By using Xacta 360 and this purpose-built C2S template, you can be sure that you're addressing only the authorization process steps, questions, and artifacts that are relevant to the successful integration within a consumer's C2S workload ATO process. The project you create with Xacta 360 and the C2S template puts the ATO information in a data format that can be automatically ingested by C2S consumers who use Xacta 360, allowing them to expedite the body of evidence (BOE) creation for their authorization process.

Help your customers maintain approval with each enhancement to your product.

As you enhance your product over time, you can use Xacta 360 to maintain your authorization package, which can then be provided to your IC customers. Just reflect the changes in your project and make the updated project available so they can review their implementation for security relevance. Xacta 360 can also be used to manage multiple projects, so you can centrally manage and maintain ICD-503-compliant projects for all of your products.

Choose the deployment option right for you.

Telos offers a variety of deployment options to make Xacta 360 flexible and scalable according to your requirements. You can run Xacta 360 locally in your environment or access it as a SaaS application in the AWS Marketplace.

Xacta's C2S Template with Sequoia Combine provides C2S users with 75% of what they need to on-ramp a new service or workload to C2S. It offers:

- Streamlined C2S three-stage workflow: quickly and efficiently provides evidence of your product's ability to be authorized.
- Streamlined C2S authorization documentation: fewer and smaller documents greatly reduce manual effort.
- C2S recommended implementation guidance: available for users to inherit C2S-specific control implementation details – greatly reduces labor intensive control implementation activity.
- C2S control interpretation: used to create custom C2S categorization questions. No need to be control experts and interpret controls. Users just answer questions.
- C2S categorization questions: ensure user responses are accurate, appropriate, and complete. Provides C2S users with all of the data they need. Eliminates potential for data omissions and gaps that result in lost time.
- C2S custom categorization questions: reduces time and effort with responses that auto-populate C2S authorization documentation, control implementation, and assessment results.

Solutions that **empower** and **protect** the enterprise.™
