

Xacta MetriX™

Powerful, modular reports that are easy to build and customize, leveraging data from both Xacta 360™ and Xacta.io™

View your data how you want to see it— as well as when you want to see it

All IT risk management teams rely on data to give them an accurate picture of risk and compliance requirements—and that data changes often. The requirements for that data often change as well, meaning that the way reports are constructed often needs to be revised. Additionally, the need for new reports is often critical and time-sensitive.

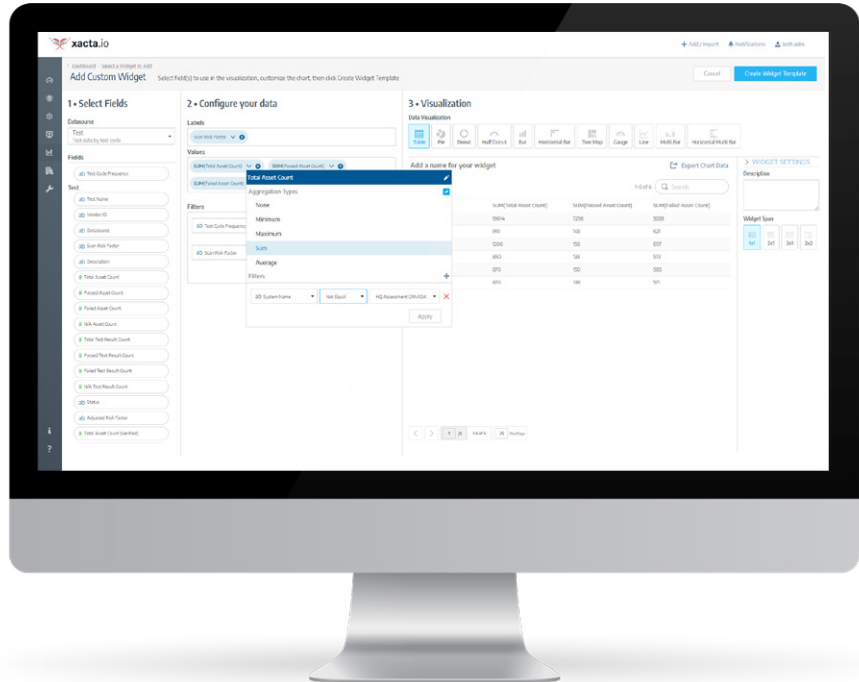

Therefore, the Xacta team wanted to build the capability to create and manage reports directly within the platform and add the capability to place those reports in a customizable dashboard.

Xacta MetriX was built to accommodate those goals. Compliance teams leveraging Xacta MetriX can easily build and edit custom widgets and dashboards that provide an overall, at-a-glance view of risk and remediations, saving a significant amount of time and effort compared to custom development work.

Creating custom Xacta MetriX widgets

Creating new custom widgets is simple. Widgets can be created based on a data source located in either Xacta 360 or Xacta.io.

Once a data source has been selected, a set of fields appears. From there, building a custom widget is a flexible process; it's simply a matter of dragging and dropping the fields you want.

Xacta MetriX includes multiple filtering options

The power of both field-level and global filters

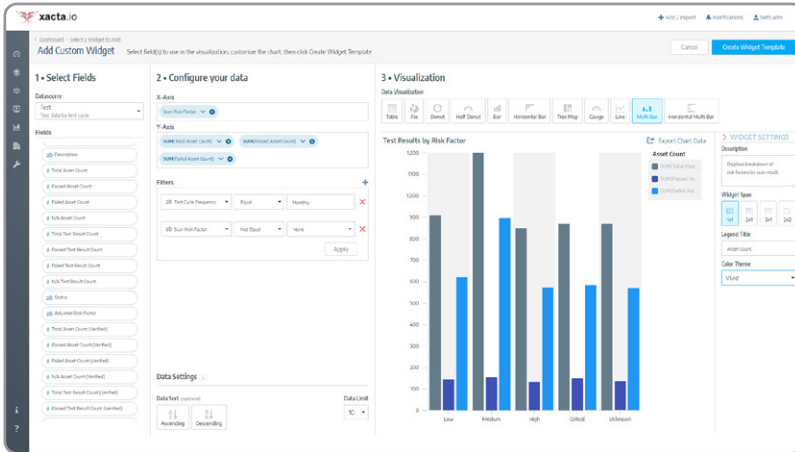

Field-level filters: While in the Configuration stage, it's possible to apply specific filters to data fields. Doing so allows you to create customized reports based on specific parameters applied to the field level.

Global filters: Xacta MetriX also allows the addition of global filters. This type of filter allows you to customize how data is displayed with the parameters you select. This powerful capability allows you to create custom widgets that (for example) display information only on specific projects and narrow the information shown in numerous other ways.

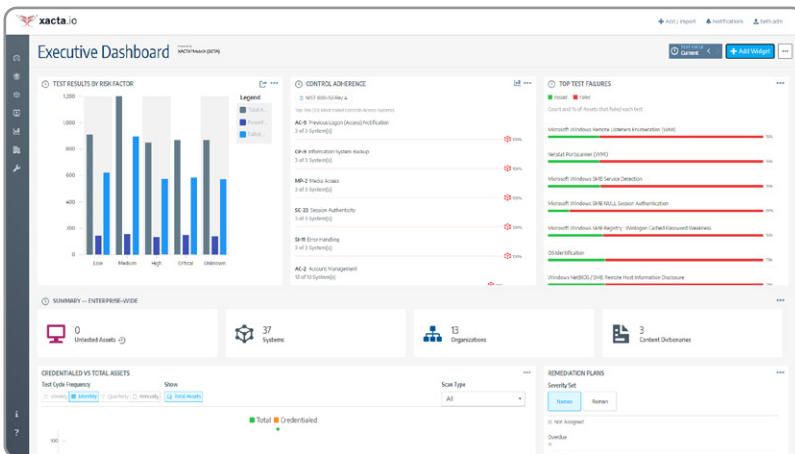

Both types of filters—used separately or together—allow you to focus on exactly the data you need to see when you need to see it.

Easily customizable views

When customizing your widget, numerous visual options are available for displaying data, including pie charts, donut charts, gauges, bar charts, and more. Depending on user preference and the type of chart displayed, a given widget can be made larger or smaller within the overall dashboard.

However, the customization options don't stop there. Not only can you change the chart size and type, but you can also choose the colors you would like for your chart. Finally, you can also reorder how information appears within the widget display.

View of customized dashboard populated with custom widgets

Once you've perfected your custom widget, you can easily embed it in a dashboard. What's more, you can save it in a library for future use.

Exporting data from Xacta MetriX custom widgets

The power of Xacta MetriX custom widgets can be extended by exporting compiled data. Users can export the data from these views in Excel or JSON format for additional manipulation in a spreadsheet or other reporting tools.

Additionally, users can export data directly from the underlying report and, if desired, skip the step of creating a widget.

A window into metric defined-risk

With Xacta MetriX, users can create and display custom widgets that fit the unique needs of their organization. They can make changes on-the-fly to accurately illustrate the data, enabling them to zero in on specific areas of concern. This adaptability allows risk and compliance teams to spend less time on reports and focus on finding quick, actionable answers.
